1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Houghton et al. (US 5,371,017) in view of Suzich et al. (1993).

These claims are drawn to recombinantly-produced native, authentic, enzymatically active NTPase/RNA helicase of hepatitis C virus (HCV), said enzyme comprising amino acids 1027-1657 of the HCV NS3 gene product; and to a recombinant method of producing said enzyme.

Houghton et al. disclose recombinant expression of the HCV NS3 gene product, including the entire coding region, fusion proteins, and truncated and altered versions of said gene product (see column 2, lines 5-9). In lines 18-55 of column 4, a "DNA construct encoding the entire NS3 domain" is specifically taught. Columns 7-10 disclose various well-established recombinant expression means in the art, including both expression of fusion proteins and nonfused (native) proteins (see especially column 10, lines 6-16). While specific examples of fusion proteins are disclosed in this patent, the teachings as a whole clearly cover recombinant expression of the full length, native NS3 gene product.

Houghton et al. do not specifically disclose an HCV NS3 gene product comprising amino acids 1027-1657.

Suzich et al. teach that the entire HCV NS3 gene product was known to reside in amino acids 1027-1657 of the HCV polyprotein (see Fig. 1A on page 6153).

One of ordinary skill in the art would have been motivated to apply the teachings of full-length, native recombinant expression of HCV NS3 (Houghton et al.) to an enzyme comprising amino acids 1027-1657 because Suzich et al. taught that these amino acids defined the HCV NS3 gene product. It would have been prima facie obvious to one of ordinary skill in the art at the time of the invention to produce and use the claimed HCV NS3 proteins.

2. In parent application 10/010,860, the arguments of the response filed 01/30/03 with respect to the instant claims have been fully considered, but are not found persuasive. On page 3 of the response, it is argued that the combined references do not teach or suggest: expression in a eukaryotic expression system; the protein comprising amino acids 1027-1657; and purification such that enzymatic activity is maintained. However, each of these limitations is clearly present in the cited prior art as specifically pointed to in the rejection; the response merely refers to certain different embodiments in the references while ignoring the broader teachings pointed out in the rejection. While the response notes on page 4 that the prior art did not recognize that the HCV NS3 gene product had both NTPase and helicase activity, it has already been explained on the record that this fact is not relevant to the rejected claims, which are product claims. It is well established in U.S. patent practice that discovery of a new property of a product already known in the prior art cannot serve as the basis for patentability for said known product.

3. Claims 15-22 remain allowable.

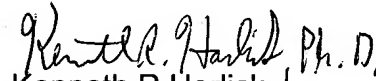

4. Houghton et al. (US 6,472,180) is made of record as a reference of interest.
